Advanced Pain Management Technology

Advanced pain management needs to leverage technology. Bioenergetics utilizes computer technology for the facilitation of better energy flow in an individual

(Newswire.net -- November 13, 2015) --Advanced pain management needs to leverage technology. Intelligent Bioenergetics utilizes computer technology for the facilitation of better energy flow in an individual. All living systems have some form of energy flow, and modern research in biology is finding new ways to tap into this reservoir on a regular basis. In fact, bioenergetics can actually promote the production of energy in living forms, as well as its utilization. Things like ATP, which stands for Adenosine Triphosphate, store energy in living beings; and bioenergetics can produce such molecules. While especially relevant to a variety of human applications, bioenergetic technology has the advantage of being trans-species. For veterinary purposes, this treatment is also commendable.

Bioenergetics can be used to aid in many regions of health. From relieving pain to improving circulation, bioenergetics has broad application. Flexibility can be increased through treatments, and recoveries from many different injuries can be accelerated. For the athlete, it is reasonable to expect an enhancement of performance. As well, there are many health benefits to programs of detoxification; especially in a culture which creates such a variety of processed foodstuffs and unhealthy confections. Bioenergetics definitely supports detoxification. For those looking for cosmetic application, reduction of cellulite is also bioenergetically feasible. A bevy of benefits from this treatment include aesthetic augmentation, declination of chronic or acute pain, reduction of arthritic condition, joint/ligament treatment for sport and other injuries, curing of headaches and migraines; as well as positive results on treatments involving sciatica, and Fibromyalgia. With more and more uses for bioenergetic technology being discovered every day, this list by no means represents either its entire contemporary scope or its future potential.

Here's how it works: Intelligent Microcurrent (IM) technology is used to scan electrical impedance within the varying interconnected tissues of a given body. When an electrical impedance is detected, IM then automatically corrects it. Eventually this leads to a normalization of the electrical patterns in the body. It is known this normalization has been achieved when the biofeedback reading indicates health. At this point, the process of healing is then able to get underway in a much more swift manner than it would without the treatment.

Intellbio provides a broad range of IM equipment; including some instruments designed for human use, and some designed for animal use. Many of the most advanced units specialize in IM treatments for performance improvement among animals such as dogs and cats; or larger animals like conventional livestock, including bovine, equine, swine and more. Intellbio also includes equipment designed more specifically for pain of a chronic nature that is related to the tissues of the brain. IM treatment is something which is absolutely ideal for means of disorders involving sleep, or other neurological conditions. Neuromuscular disorders also supremely benefit from this kind of treatment.

Results from this modern treatment are absolutely dramatic. IM therapy can literally wipe years away from a person's face; and athletes have been using it for years to maintain their gaming presence in the face of multiple, regular injuries.

This technology is cutting edge, and medically proven. There are no shortage of adverse treatments that do nothing to actually rectify any conditions. From obscure eastern traditions to modern therapies not proven negative until they'd already invaded the public consciousness. IM, by contrast, is demonstrable and scientifically vetted.

The human body is a complex, integrally designed machine whose secrets are revealed regularly over time. There's a reason medicine is called a "practice", and the tongue in cheek answer is that this word truly describes the discipline. Modern medicine has certainly made exceptional leaps in the last several hundred years, but there are still untold

frontiers of knowledge to be discovered. IM treatment is the tip of the iceberg in that regard, and Intellbio a vanguard for such progress. But words are only worth so much. It makes sense to bring this technology to hospitals and practices which may have previously been unaware of it. When people are able to recover more quickly, they are able to be more proficient members of society on a number of fronts. When the man with the migraines is suddenly headache free, now he can put more work into his journeyman pursuits, rather than the stilted output his headaches gave him. Applied across the nation, this pain management treatment will prove revolutionary.
