Lasik Eyes Center  April 12, 2014

LASIK Surgery is conducted to correct eyesight related problems. This laser vision correction program is conducted in a variety of hospitals but there are specialized LASIK centers in Singapore which offer exclusive LASIK surgeries like LASIK Eyes Center.

(Newswire.net -- April 12, 2014) Singapore, SG -- Get Rid of Eye Glasses and Contact Lenses with LASIK in SINGAPORE

LASIK or Laser In-Situ Keratomileusis is a very common surgical procedure that is conducted to correct eyesight related problems. This laser vision correction program is conducted in a variety of hospitals but there are specialized LASIK centers in Singapore which offer exclusive LASIK surgeries. It is a kind of refractive surgery that corrects eyesight disorders such as myopia (short sightedness), hypermetropia (longsighted or farsighted) and Astigmatism (blurred vision). The procedure has been performed successfully in most patients and is a permanent alternative for contact lenses or eyeglasses. People below the age of 18, pregnant women, people with eye infections, individuals with unstable eye refractive power or people with thick cornea cannot undergo this surgery.

In case traditional LASIK using the microkeratome blade is not possible, an improved alternative procedure such as the IntraLase bladeless procedure is performed on them. There are two techniques that are used to conduct LASIK surgery. Both the techniques are performed to restore eyesight to the nearest perfection. Patients who have successfully undergone the surgery will definitely not need contact lenses or glasses later. It depends on the doctors and the patients’ condition as to which technique is best suitable. At the Lasik Singapore Eye Centers patients can get detailed information about the procedures. They might want to clear any or all doubts with regards to the procedure before going for treatment.

The patients need to be assessed by the doctors before any kind of procedure is conducted. They would basically check for any faults or preexisting conditions that may be hindrances in the process. Patients will be made aware of the risks as well as benefits involved in the process. It is recommended that patients stop wearing their contact lenses 3 days prior to evaluation. The eyes will take their natural shape during these three days and will allow proper correction. During the evaluation, the process of surgery is explained to the patients clearly. Patients can make their decision accordingly. Proper medication will be given post treatment in order to help the healing process.
