

Fence Construction Advice Website Breaks Ground

Brian Hanson February 27, 2016

The website for Security Fence Builder is online for the first time today. The website helps property owners design and install a fence.

(Newswire.net -- February 27, 2016) Seattle, WA -- A new website intended to help homeowners and other property owners learn more about having a fence built on their property is underway starting today.

The Security Fence Builder website provides information about some of the common options property owners have when it comes to building a fence on their residential or business property.

The site's publisher, Ian Phi, said he hopes his new site will help property owners understand their options when it comes to which type of fence to install, find a couple of good potential contractors to work with, and reduce the time and effort needed to get a fencing project started and completed.

"This website is primarily intended for a property owner who has some interest in having a security fence installed, but doesn't really know that much about their options," stated Phi, "This website is designed to show them some popular options in fence construction regarding materials, appearance and function."

"Look, most homeowners don't have any previous experience with designing and building a fence," continued Phi, "They are usually interested in one or two of the obvious benefits of a fence, such as increased privacy or security, but they aren't too aware of the different options, the benefits and drawbacks of the various materials or the cost of having one installed."

"Talking with a professional fence contractor is a good first step. An experienced fence builder will give a property owner the benefit of their years of experience with building and evaluating past fence construction jobs," he said, "These builders can offer their advice on what they think will work the best for the property owner."

Fence Construction is Best Left to a Professional

While some homeowners might be interested in installing a fence by themselves in order to save money, Phi stated that this is usually not a good idea.

"Some homeowners get the idea that they can install their own fence," Phi said, "And maybe if their project is rather small, and it's in their backyard, and they have some experience with doing it before, maybe they can try it. But the vast majority of homeowners will not be able to install a long fence and have it look great when they're done."

"Building a long fence and keeping it straight and level, especially when it's built on a sloped or uneven lot, is difficult," Phi continued, "Plus, a professional contractor will investigate and understand any potential zoning regulations or building requirements that need to be followed when putting a fence in. A homeowner can make a big mistake by trying to do it all by themselves."

"The last thing you want in your yard is a fence that looks like it was installed by a complete amateur," concluded Phi, "You want your fence to improve the appearance of your property and increase its market value, not do the opposite."

Phi mentioned that besides the fence companies that install permanent fences, there are also several contractors that will put up temporary security fences. These projects are usually completed at commercial job sites and are often designed to reduce theft and vandalism during building construction.
