RFID blocking sleeves are designed to block signals between credit cards and card skimmers and prevent identity theft.

(Newswire.net -- November 1, 2016) Tallahassee, FL -- Identity theft is one of the threats that continue to victimize many consumers nowadays. Financial institutions and companies are already resorting to preventive measures to increase the protection of credit card holders. Consumers can also resort to do-it-your-own methods to reduce the risk of being

victimized by these criminals.

Experts recommend the use of a tin foil wallet shield in warding off identity thieves. The radio frequency identification (RFID) technology has been introduced and used as an enhanced security feature. The RFID chip is intended to offer added protection to the credit card.

However, unfortunately, fraudsters have still found ways to steal credit card information. Today, there are card skimming devices that work by reading and stealing personal information from credit and debit cards even if the victim and fraudster are a few feet away from each other.

Thieves do not even have to make physical contact with the victims. There are also apps designed to activate tablets and phones in reading credit card information.

Once credit card data has been obtained, thieves can then use it to make purchases, take loans, or for other fraudulent purposes. The tin foil method is believed to be an effective weapon for consumers who can be identity theft victims anytime.

Electronic credit card theft is a fast growing crime in many areas around the world. The good news is that there are several options available that can help consumers fight fraudsters.

Victims of identity theft are often subjected to the hassles of clearing up their names and checking out their financial statements to see if recent transactions have been made. Before this even happens, consumers can resort to preventive measures such as the tin foil method.

Consumers just need to gather materials such as a wallet, tin foil, and ruler. The ruler should be used to measure the foil. Cut and fold the foil according to the size of the wallet, and then place it inside covering the cards.

With these simple steps, consumers can reduce their risk of being victimized by identity thieves.

There are also other remedies such as the use of RFID blocking sleeves. These sleeves are becoming more and more popular these days due to the protective effects they provide to consumers.

The RFID blocking sleeves are designed to block the signals between the credit card and card skimmers. This prevents thieves from obtaining personal information and commit their crime. They can be used to cover credit cards and placed inside a wallet.

The RFID blocking sleeves are available for purchase at [amazon.com](http://amazon.com/rfid-passport-sleeve-protector/dp/B0150T0AI2). (<http://amazon.com/rfid-passport-sleeve-protector/dp/B0150T0AI2>).
