Endometriosis is a common medical condition that may subject sufferers to irregular menstrual bleeding and pain.

(Newswire.net -- March 3, 2017) Orlando, FL -- Resveratrol has been widely believed to be highly therapeutic. As a matter of fact, more and more scientists are investigating the possible therapeutic effects it may potentially offer. This natural alternative is also thought to be beneficial for women who suffer from certain medical conditions.

Resveratrol is believed to help overcome endometriosis. Endometriosis is a condition that usually involves pelvic pain and infertility. By definition, endometriosis is the occurrence of ectopic endometrial tissue. Sex hormones are believed to constantly influence the implants of endometrium.

According to preliminary tests involving mice, resveratrol, which is an organic antioxidant polyphenol, might play an important role in endometriosis therapy.

A group of Brazilian scientists conducted a clinical trial to determine the effects of resveratrol on pain levels when it's added to conventional oral contraceptives. At the end of the research, the scientists achieved encouraging results for the potential therapeutic effects of resveratrol.

Endometriosis is a common medical condition that may subject sufferers to irregular menstrual bleeding and pain. It is characterized by an extra tissue that produces scarring in the reproductive organs as well as in the pelvic area.

It is believed that this condition may be an immune system disorder. The activation of mast cells is part of the immune system. It is important to note that mast cells are linked with allergies as well as inflammatory conditions.

Mast cell activation can actually lead to the release of many inflammatory proteins, which include the tryptase enzyme. This enzyme is believed to work by stimulating the production of type 1 collagen, which aids in the formation of fibrotic tissue present in endometriosis cases.

In a clinical study, the researchers studied 13 participants, 10 of which had endometriosis. The endometriosis sufferers were found to have significantly higher numbers of mast cells. A majority of the mast cells were activated and were producing inflammatory and fibrotic factors.

Conventional pharmaceutical medications are typically used for endometriosis pain relief. They are also used to delay or stop the progression of the condition. Unfortunately, these medications do not cure the condition and may lead to adverse side effects.

Resveratrol may be a natural and safe option for women with this type of chronic condition. In a study, it was found that resveratrol has successfully reduced pain as well as inflammatory mast cell lesions.

Resveratrol can be found in a variety of food sources, but can also be obtained through supplementation.
