Turmeric has been believed to be safer than medications. It could possibly offer a myriad of health benefits, and this is why more and more people are turning to its use.

(Newswire.net -- August 16, 2017) Orlando, FL -- The popularity of natural remedies continues to increase, and this is due to the fact that they are widely believed to be safe and effective to use. One of these remedies is turmeric.

Turmeric is one of nature’s gifts for liver health. Fatty liver is a medical condition that affects an increasing number of people. Diabetes and obesity are considered to be two major health threats, and unfortunately, they significantly increase the risk of developing fatty liver.

In a new study, it was found that the polyphenols in turmeric are potentially helpful in decreasing the risk of fatty liver and stress at the cellular level.

Turmeric has long been popularized by its bioactive ingredient called curcumin. This phytochemical has many healing agents, which are believed to be responsible for many of its therapeutic effects.

In December 2015, the Archives of Animal Nutrition published a recent study, which investigated the impacts of turmeric polyphenols on the livers of cows. Conventional feedlots are typically dirty and crowded, and this is believed to cause them a great deal of stress.

The health of the liver is typically affected by the physiological changes caused by stress. This is also believed to possibly happen in humans. Researchers suggest that one of the contributory factors of fatty liver development is the physiological stress of the liver’s endoplasmic reticulum.

In the study, it has been observed that there was a significant reduction in the major stress hormone of the liver. This improvement happened in the group of cows treated with the mixture of green tea and turmeric.

The researchers also found that the irritation markers decreased, and this could possibly imply a reduced risk for fatty liver.

The investigators suggest that turmeric could be helpful in decreasing fatty liver in cows. Studies are still underway to validate if turmeric could also be helpful in humans too. However, more and more people have been using this spice for medicinal purposes.

Turmeric has long been popularized by the therapeutic effects it offers. It is thought to offer protection against neurological disorders as well as provide support for a healthy aging process.

There are many people who turn to the use of turmeric, especially those who suffer from certain diseases or disorders. There are those who use it as a natural and safer alternative to pharmaceutical drugs.

Turmeric has been believed to be safer than medications. It could possibly offer a myriad of health benefits, and this is why more and more people are turning to its use.
