Curcumin is a phytochemical found in turmeric, and it is believed to be responsible for many of the spice’s healing effects.

(Newswire.net -- October 24, 2017) Orlando, FL -- Epilepsy is one of the conditions that causes a variety of troublesome symptoms. While there are medications available, it is also wise to take into account the use of natural remedies.

Turmeric’s anticonvulsant effects are beneficial for epilepsy. There are many herbs and spices widely believed to be extremely therapeutic. There are even many individuals who suffer from certain diseases or disorders who rely on the use of natural remedies.

This Ayurvedic spice called turmeric has been used for thousands of years in fighting a range of ailments. Turmeric has long been thought to have the ability to deliver some life-saving health effects.

Curcumin is a phytochemical found in turmeric, and it is believed to be responsible for many of the spice’s healing effects. Some of the healing agents of curcumin are its antibacterial, antibiotic, anticarcinogenic, antioxidant, anti-inflammatory, antiseptic, and antiviral properties.

The condition called epilepsy, on the other hand, is characterized by unexpected surges of electrical impulses to the brain. This condition normally causes seizures, and the severity and frequency of these seizures may actually vary from one person to another.

There are those who simply stare blankly for a few seconds while others have full-fledged convulsions. Those who experienced more than one seizure are often diagnosed with epilepsy.

Some of the symptoms of epilepsy are loss of consciousness or confusion. Individuals with epilepsy normally suffer from the same type of seizure every time an episode occurs.

Some of the different types of seizures are simple focal, focal, complex focal, clonic, generalized, atonic, myoclonic, and tonic-clonic. According to some experts, epilepsy could be caused by dementia, head trauma, and genetics. It could also be caused by conditions such as stroke, heart attack, or meningitis.

Prenatal injury that is caused by poor maternal nutrition could be a cause of epilepsy. The treatments include certain medications and surgeries. There are those who are advised to take certain pharmaceutical drugs to get sufficient sleep. They may even be provided with a medical alert bracelet in case they suffer seizures outdoors.

In addition to the therapeutic agents contained by turmeric that are mentioned above, it also has anticonvulsant properties. Thus, it could potentially be helpful for epilepsy as well as other conditions that affect the central nervous system.

This may include tremors, pain, bipolar disorders, mood disorders, schizophrenia, and certain neurodegenerative diseases.

Researchers in New Delhi reveal that this ancient, medicinal spice has the potential to cure cognitive functions after epilepsy treatment.

It is important to understand that oxidative stress happens when free radicals start affecting cellular functioning.

In a study, laboratory rats with oxidative stress and cognitive impairment were treated with curcumin. The researchers found that administration of curcumin plus phenytoin resulted in a significant reduction of both oxidative stress and
cognitive impairment.

It is further worth mentioning that turmeric has been able to boost memory. There are anti-epilepsy medications formulated to treat neurological problems. However, it can’t be denied that they cause side effects. There are even those that cause DNA damage as well as cognitive impairment when used on a long-term basis.

Turmeric could be a safer and effective alternative to these medications. It could deliver some significantly helpful therapeutic properties without causing adverse effects.
